## Polypropylene Casework

**Laboratory  
Design & Supply**

**770.932.1118**

Air Control's **polyproLABS®** line of corrosion resistant polypropylene (polypro) casework and clean storage systems is the best available lab furniture on the market for caustic, critical processing environments.

Entire TRACE METALS ANALYSIS laboratories may be specified as having NO EXPOSED METALS, in any of our equipment and furniture.

All "hardware" including door hinges, latches, drawer suspension systems, handles and plumbing ac-

cessories are made from polypropylene. "Scratch-resistant, corrosion-resistant" polyethylene worksurfaces are unique to our line of casework and fume hoods. Epoxy or laminate materials may be selected as options.

All workmanship and components are designed and built in accordance with the SEFA standard of construction for the laboratory casework industry.

## Casework Specifications

### DESIGN:

1. All casework has a "flush surface" design and is built in accordance with the standard of construction for the laboratory casework industry.

2. All base and storage cabinets have an integral base with toe space that is 4" high and 3" deep. This integral base allows each cabinet to be used as a single stand-alone unit or in a group.

3. All components, including "hardware", are polypropylene or other plastic material. No exposed metals exist within the cabinetry.

### MATERIALS DESCRIPTION:

1. All materials are of the highest quality whether they be raw plastic, sheet, hardware, or in completed product form.

2. All polypropylene raw sheet materials are inspected prior to fabrication and certified to be free of any visual or structural defects, which would prevent parts from being made to blueprint specifications.

### MATERIAL GAUGES:

1. Polypropylene material is available in ¼", 3/8", ½" and 1" thickness. Individual replacement parts including doors, filler panels, drawer bodies and shelves are all available in these thicknesses.

### CABINET CONSTRUCTION:

1. Cabinets: Construction of 100% refrigerator white, stress-relieved, acid-resistant, polypropylene. The cabinet structure is typically built with ½" material. Countertops are welded or

screwed to cabinet, typically using ½" or 1" thick material. All joints are thermally welded by special process, which ensures leak-tight, superior strength, flush unions. No metals are used in cabinet. 4" high x 3" deep toe space is standard. All polypropylene countertops include a 4" high backsplash, thermally welded to the countertop. Cabinet may be specified with removable rear panel for chase access. Plastic coated levelers may be installed.

2. Doors: Doors are solid 3/8" thick polypropylene with beveled, smooth edges. Hinges and screws are polypropylene. Door catches are plastic in lieu of metal magnet type. Door handles are available in a variety of plastic configurations and colors. Polypropylene material ensures doors to be strong, rigid and sound dampening.

### 3. Drawers:

Drawer bodies are all 3/8" polypropylene in construction. The drawer bottom and sides are thermally welded together making a leak-tight compartment. Drawers have built-in draw stops to prevent accidental pulling out. Drawers may be easily removed for cleaning. Drawer handles are plastic and available in several styles and colors.

### 4. Drawer Suspension:

Drawers slide quietly and evenly on a polypropylene "notched groove" system. System contains no metal. The drawer suspension system is rated to

withstand countless cycles at 100 pounds.

### 5. Shelves:

Shelves are made from solid ½" polypropylene. Shelves are supported by polypropylene structure. Individual shelves may be specified as removable, adjustable and/or perforated.

### 6. Fabricated Accessories:

All accessories required for specific installations are fabricated and finished to the same material quality standards as the base units they are made to compliment.

### 7. Wall Cabinets:

Wall cabinets are made of the same quality standards as base units. Materials used are noted above. Hardware and shelf systems are the same as in the base units. All wall cabinets are made with hanger brackets for ease of installation.

### 8. Wall Cabinet Glass:

Available in framed safety glass, acrylic or PVC

### 9. Options:

a.) Base units may include full plumbing and electrical services. An array of sinks, tanks, gas petcocks and electrical receptacles may be selected for factory installation within cabinet.

b.) Polypropylene may be substituted with PVC, PVDF, polyethylene or stainless steel. Fire retardant polypropylene is also available.

c.) Polypropylene is available in white, blue, black and natural (translucent).

# Casework Products

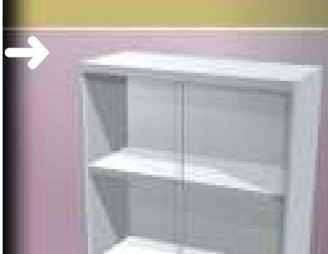

All polyproLABS® products are manufactured with acid-resistant polypropylene with no metal to rust.

## Standard Features on polyproLABS® Casework

### Standard Dimensions for Wall Cabinets:

Width—18", 24", 30", 36"  
42", 48"  
Height—24", 30"  
Depth—13"

### Standard Dimensions for Base Cabinets:

Width—18", 24", 30", 36",  
42", 48"  
Height—30", 36"  
Depth—22"

Air Control's **polyproLABS<sup>®</sup>** line of corrosion resistant polypropylene (polypro) fume hoods is the best available on the market for caustic, critical processing environments.

"Scratch-resistant, corrosion-resistant" polypropylene worksurfaces are unique to our line of fume hoods.

All workmanship and components are designed and built in accordance with the SEFA standards for the laboratory fume hoods industry.

## Fume Hood Specifications and Options

### GENERAL:

1. Polypro fume hoods are designed for full operator protection, continuous and easy access to the hood interior, while exceeding OSHA exhaust requirements.

2. Polypro hoods are specifically suited for the most corrosive environments because of their non-rusting characteristics.

### MATERIALS DESCRIPTION:

1. All materials are of the highest quality whether they be raw plastic sheet, hardware, or in completed product form.

2. All polypro raw sheet materials are inspected prior to fabrication and certified to be free of any visual or structural defect, which prevents parts from being made to blueprint specifications.

3. PVC, PVDF, polyethylene, Teflon<sup>®</sup>, or any other plastic material used as substitution for polypro, is subjected to the same material quality control programs (see polypro material specifications page).

### CONSTRUCTION:

1. Fume hoods are manufactured with no exposed metals. Units are constructed of 100% refrigerator white, stress relieved, acid-resistant polypropylene. The hood structure is typically built with 3/8" thick material. All joints are thermally welded by special process, which ensures leak-proof, superior strength, flush unions. Polypro is also available in 1/4", 1/2" and 1" thickness.

2. Polypro hoods are typically free standing, one-piece hoods with

polypro storage underneath. The "picture frame" hood access area profile has a 7° slope away from the operator, to promote ergonomic comfort.

3. Each fume hood contains an internal baffle system of the same material as the unit itself. This baffle system provides safe and efficient removal of fumes when the hood is connected to a properly installed exhaust system. A manual adjustment is provided on the baffle system to allow the operator to adjust the extent to which the environment is under negative pressure.

4. All polypro hoods have across-the-work-surface exhaust with adjustable louvered shutter(s), and above-the-work-surface exhaust with adjustable louvered shutter(s).

5. Units have top-located round exhaust duct collar(s), with butterfly dampers included. Rectangular exhaust duct connections are also available.

6. Each superstructure contains top-located fluorescent lighting. All lighting is placed in fume-tight compartments with translucent polypro windows. For polypro fume hoods with laminar flow clean air option, "flow-through" lighting is utilized so as to not disrupt movement of laminar flow, clean air. Lighting provides greater than 100-candle power illumination and is factory pre-wired to NEC and NFRA code.

7. Fume hoods have a full view, vertical rising, safety sash installed. Each sash is counter balanced by two plastic coated cables attached to

rear-of-hood located, plastic encapsulated weights. Each sash moves easily and closes fully, within one inch of work surface.

8. Hoods are provided with an air by-pass feature. The by-pass, located at the upper front interior of the hood, opens as the sash is lowered, providing for a near constant exhaust volume of the fume hood superstructure.

9. Pressure drop across the fume hood exhaust system is less than 0.5 inches of water, when operating at an average velocity through the front access opening of 100 feet per minute. Exhaust failure alarms may be installed for security and user protection.

10. Work surfaces in polypro fume hoods are constructed of one-inch thick solid polypro, with a front located lip to contain spills. Models with wash-down tubs underneath the work surface, lend themselves to perforated or recessed "lip exhausted" work surfaces.

11. Polypro hoods are supported by strong polypro "box" structure. Each unit contains acid-resistant storage

# Fume Hood Specifications and Options

underneath, which may be vented to the hood exhaust plenum. All polypro base cabinetry has a “flush surface” design and is built in accordance with the standard of construction for the laboratory casework industry. Doors are solid polypro material with beveled, smooth edges. All hinges, screws, and other “hardware” are plastic. Storage floor is leak-proof to contain spills of corrosive substances.

12. All plumbing and electrical terminations are at rear of unit. Placement may be specified by customer.

13. Airfoil across bottom of hood opening.

14. Double side-wall construction with removable panel to access plumbing.

## POLYPRO FUME HOOD OPTIONS:

1. Polypro, non-metallic, fume hoods are available with built-in Class 100 laminar flow air environments. These one-piece “positive/negative” environments provide full operator fume protection as per OSHA and ASHRAE 110- 1994, and Class 100 or better clean air for critical processing, as per Fed. Std. 209-E.

2. Polypro Walk-in fume hoods are available, with or without Class 100 Clean air. The sash consists of two ver-

tical, or horizontal sliding panels. Each vertical panel has its own independent weight cable and pulley system as specified under “Construction”.

## OPTIONS:

1. Polypro hoods may be specified with a variety of tanks, tubs, work surface configurations, process sub-systems and equipment, and electrical and/or gas services.

## Fume Hood Products

All **polyproLABS®** products are manufactured with acid-resistant polypropylene with no metal to rust.

Part Number	Description	Enhanced Description	Length	Width	Height	Weight	Lead Time
